

Anton Vikharev

Senior Unity Engineer | Gameplay,
Multiplayer & AI-Assisted
Development

CONTACT

LOCATION

Tbilisi, Georgia

CONTRACTING

Registered company and bank account
in Tbilisi, Georgia – invoicing in USD /
EUR

HOURS

UTC+4 · 7 years working with US Pacific
teams

EMAIL

SKILLS

Engine & Languages

Unity, C#, .NET, C++, Python

Multiplayer & Simulation

client-side prediction, latency
compensation, deterministic physics,
authoritative servers, Photon (PUN +
server plugins), ECS / DOTS, cheat
detection

Gameplay & AI

behaviour trees, A* pathfinding,
procedural generation, custom shaders,
Spine, DOTween, game-design math
tooling

Performance & Tooling

Unity Profiler, build-size and memory
optimization, Addressables and
AssetBundles, custom Editor tooling,
Zenject, Git

AI-Assisted Engineering

Claude Code, multi-agent orchestration,
spec-driven development, automated
code review and regression gates

PROFESSIONAL SUMMARY

Senior Unity engineer with 12 years of software development experience, including seven years working remotely with a US game studio. Shipped four commercial games, including Travel Crush (1M+ downloads), and a cross-platform Unity SDK. Specialise in gameplay systems, deterministic simulation, multiplayer networking, and performance optimisation. Led teams of up to four engineers and use AI coding agents with specification-driven workflows, automated review, and regression testing.

WORK EXPERIENCE

Independent Unity & Backend & AI Engineer

August 2024 - Present

Own practice – contract engineering – Remote

- Prototyped an MMO architecture with a custom ECS backend server and Unity ECS client, sustaining 1,000 concurrent players in load testing
- Finished a match-3 prototype in Unity for the Banana Games startup, from empty project to playable vertical slice
- Built out an AI-assisted engineering practice: agent-driven refactors, test generation and tooling for C# / Unity codebases
- Developed an AI-native production CRM, from stakeholder discovery to delivery, orchestrated Claude Code agents to implement the system in Next.js / Express / PostgreSQL / Docker, using spec-first workflows with automated review and regression gates, ran discovery with end users and stakeholders to design UI/UX around existing business processes rather than forcing the business to adapt to the software
- Built and launched 2 commercial Telegram bots with .NET / PostgreSQL / Docker, created own .NET backend framework for this purpose
- Discovered a high-severity vulnerability in UMA Protocol (Polymarket's oracle) Solidity smart contracts, earning a \$10,000 bug bounty. Write-up: <https://medium.com/@chaincastsystems/bug-bounty-1-umas-dvm-contract-schedule-queue-dos-7065d3100694>

BebopBee, Inc.

July 2016 - August 2024 · 7 years, three tenures

Menlo Park, CA, USA – fully remote

Unity Tech Lead

August 2023 - August 2024

Travel Crush – match-3 mobile game, 1M+ downloads

- Led a team of 4 client engineers; owned architecture and implementation plans for client-server features alongside the product team
- Migrated the game backend from Python / Tornado to BrainCloud BaaS
- Shipped multiple live-ops events on the no-code content pipeline
- Built a procedural animation system letting effects artists author dynamic flight curves for UI elements without engineering time
- Ran technical interviews for engineering candidates and drove sprint planning, translating product requirements into data structures, algorithms and technical specifications

Backend

ASP.NET Core, EF Core, PostgreSQL, Redis, RabbitMQ, Node / Express, Docker, BrainCloud BaaS

LANGUAGES

English – fluent (8 years in US engineering teams)

Russian – native

EDUCATION

September 2007 – June 2013

Bauman Moscow State Technical University

MS in Ballistics and Aerodynamics

Thesis on optimal out-of-plane orbital transfer, LEO to GEO, via Lambert's problem

Unity / C# / Python Fullstack Engineer

March 2018 – August 2022

Travel Crush

- Built the core match-3 engine and an in-editor level designer that let designers play and tune levels without leaving Unity
- Created a dynamic difficulty system that auto-balances level difficulty against player skill to sustain engagement
- Developed AI-driven automated level playtesting for bug detection and difficulty analytics
- Engineered a live-ops event system enabling no-code content delivery
- Built a custom AssetBundle delivery system for grouping and background-downloading assets before Unity Addressables was released
- Optimized UI for high-framerate rendering, including embedded scroller views, and wrote custom shaders for sprite rendering
- Implemented social systems in the Unity client and Python backend: friends graph, social notifications, global and in-event leaderboards on Redis, player-to-player gifts
- Integrated Facebook, Google and Apple sign-in across client and server, plus an embedded third-party video player bringing video content into the game meta

Unity / C# Software Engineer

July 2016 – March 2018

Super Jump League – real-time multiplayer PvP

- Built a deterministic 2D physics engine (quad-to-quad, quad-to-tilemap, quad-to-circle collisions) as the basis for reproducible networked gameplay
- Implemented the networking engine with client-side prediction and latency compensation for smooth synchronization between clients in session multiplayer
- Implemented A* pathfinding with behaviour trees for bot AI, fully synchronized across clients
- Built cheat detection via Photon server plugins
- Designed the session multiplayer lobby, with bots backfilling low-population hours
- Designed and implemented the character progression meta-game system
- Cut build size by 50% in one week; drove soft-launch readiness through systematic QA and polish

Unity / C# Software Engineer

August 2022 – June 2023

Ankr – Remote

Cross-platform SDK for a Web3 SaaS platform

- Sole Unity engineer – shipped a cross-platform Unity SDK, including WebGL, one month ahead of platform launch
- Integrated third-party APIs for cross-platform transaction processing inside the SDK
- Contributed to ASP.NET backend services on PostgreSQL, EntityFrameworkCore and RabbitMQ after SDK delivery

Unity / C# Software Engineer

August 2015 – June 2016

Crazy Panda – Moscow

Stellar Age – mobile MMO strategy

- Created procedural galaxy generation for 100,000+ planets
- Built a quad-tree rendering system for smooth infinite zoom from galaxy view to planet view
- Built Editor extensions for validating game-design math

C++ Software Engineer

May 2014 – December 2014

Biart – Moscow

- Gameplay and engine work on Depth Hunter 2: Deep Dive, released on Steam
